Do you know this problem?

A good friend calls you having a problem with his windows system. Unfortunately he lives too far away and you don't feel like to visit him.

Additionally he does not know anything about networks. So he cannot configure his DSL router to let a remote tool have access to his computer.

However it can be easy. With Teamviewer you get a remote control and presentation software that leaves firewalls by side and can be used without much work.

Download and run Teamviewer on your and yours friend computer - without installation and registration! Try it now!  
Free Remote Control
